

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

Leaf structure.—Most botanists are familiar with the contributions of Dr. COCKAYNE to our knowledge of the flora of New Zealand and the adjacent islands. On his trip to the southern islands several years ago, he brought back a number of living plants which are now growing in the rockery of Canterbury College. These plants have been made the subject of an anatomical investigation by Miss HERRIOTT.³¹ In spite of the uniform climate of the southern islands, many if not most of the plants reveal xerophytic structures. The author cites two conditions in these island regions which may be regarded as xerophytic. One is the frequency and violence of the wind, and the other is the peaty soil.—H. C. COWLES.

Forestry.—Two recent bulletins of the Bureau of Forestry will be of some interest to ecological workers. One of the bulletins³² describes the valley and ridge forests of Kansas and Nebraska and their economic possibilities. The natural extension of both types of forest is discussed, but this subject will be well known to all through work of Professor C. E. BESSEY. The other bulletin³³ is almost wholly of economic interest, but ecologists will find some notes on the natural reproduction of the white pine in the old fields of New England.—H. C. COWLES.

Hygroscopic mechanisms.—STEINBRINCK, who has given particular attention to hydrophysics, summarizes for non-technical readers the mechanisms of shrinkage and cohesion in plants.³⁴ It is these mechanisms which are concerned chiefly in the rupture of capsules and sporangia. The current conceptions as to the rupture of the latter particularly need correction, and the article is commended to students. In his *Literaturübersicht* he has indeed overlooked American literature on this subject.—C. R. B.

Biology of Dunaliella.—In 1905 TEODORESCO described³⁵ Dunaliella as a new genus of Volvocaceae, giving an account of its structure and life history. In a second paper³⁶ he has begun an account of certain "biological observations." In this first instalment these observations deal with changes in the form of the body, cell structure, cell division, sexual reproduction, and the resting condition.—J. M. C.
